

Project Title - Online Insurance Policy Management System – UAT Simulation

Project Objective :

The goal of this project is to simulate an online insurance policy management system to demonstrate User Acceptance Testing (UAT) processes. Customers can purchase insurance policies, track their status, and submit claims, while admins approve or reject claims. This project validates that the system meets real user needs and business requirements.

Users :

1. **Customer** → Can register/login, browse policies, purchase policy, view dashboard, submit claim
2. **Admin** → Can approve/reject claims, view all policies

Features

1. Customer Features:

1. Register / Login
2. Browse Insurance Plans
3. Purchase Policy
4. View Policy Dashboard
5. Submit Claim

2. Admin Features:

1. View all policies
2. Approve / Reject claims

Business Problems Solved

1. **Manual tracking of policies and claims** → Customers currently have difficulty tracking their insurance policies and claim statuses manually. This system allows customers to view their policies and claim progress online, eliminating the need for physical paperwork and reducing errors.
2. **Delays in claim approvals** → Admin teams often face delays when reviewing and approving claims manually. By providing a digital admin panel, the system allows faster and more accurate claim approvals and rejections.
3. **Data accuracy issues** → Manual processing of insurance policies can lead to errors in customer data and policy details. The system ensures that all data entered by customers and admins is validated, reducing mistakes and improving reliability.
4. **Lack of transparency** → Customers often cannot see the real-time status of their policies or claims. This system provides a transparent workflow, allowing users to monitor the status of their requests and transactions instantly.
